Project Summary:

This idea was inspired by the prompt given for Mystery Manor, we have a deviation from that initial prompt to something that's a hybrid between that and classic social deduction games such as Clue, Blood on the Clocktower, Werewolf and more. Instead of working with cases and evidence, the player will be embedded directly into an ongoing situation where they are a member of a town being subjected to the torment of a demon. The player and 8 NPCs will be assigned roles with special abilities that grant information (also read building cases) on their co-inhabitants. Each day, the player will be allowed to speak with three other members of the town before being asked to vote on a person to execute who the town expects to be the demon and each night the demon will kill one person. Information will be assigned to each role and be dished out based on what state the game is in, it will be acquired from a local database holding various information for each role, and which one is given will be decided by the NPCs attitude towards the player. Roles and attitudes towards the player will be dispersed, so some NPCs might be more helpful than others between games. The player will be assigned a 'good' aligned role every time, and the 'evil' roles will have information that mimics the information given by 'good' NPCs, but wrong which will be the deduction element for the game. Find out who's lying and what information you can trust along the way.

CRUD Description:

Character roles will be held within a table with a random one being assigned across the 'player' list on each new iteration of the game loop. Roles will contain abilities, information given, allegiance towards the player, and a few other game specific details we haven't quite fleshed out yet.
